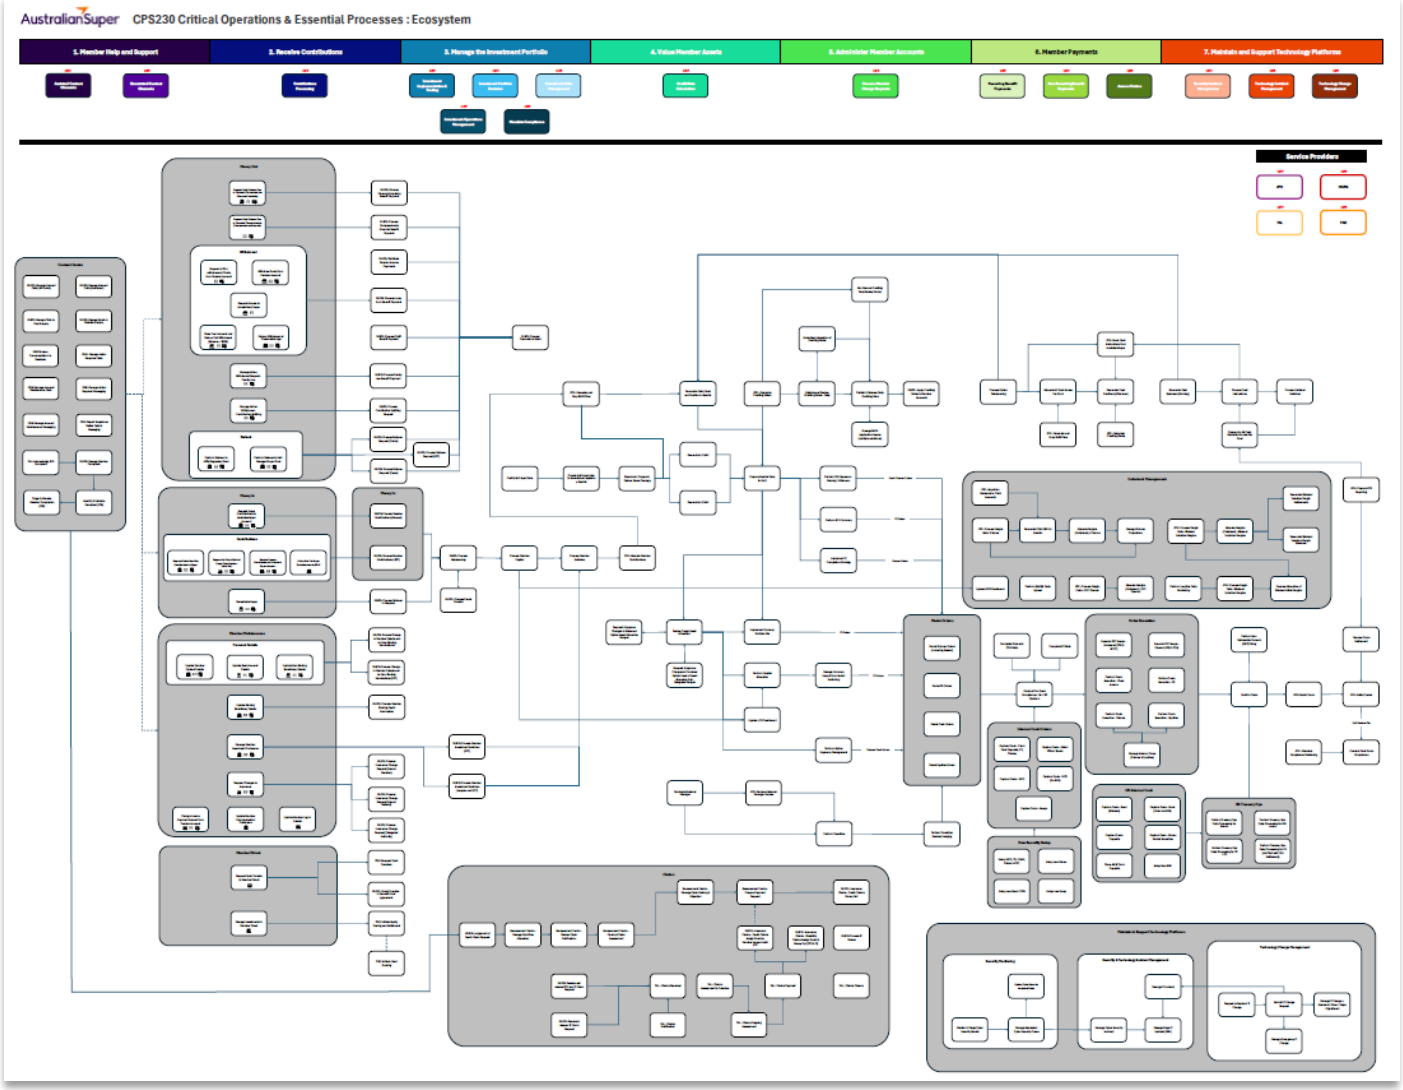
CPS230 Critical Operations Ecosystem

Business Resiliency Team

The CPS230 Critical Operations Ecosystem



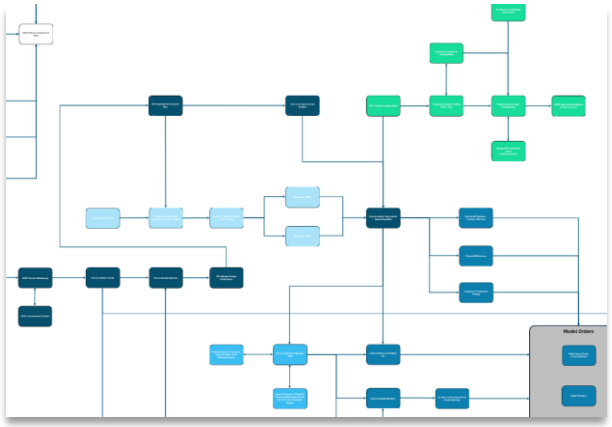
- This diagram shows the interdependencies and connections of the Essential Processes that support the Critical Operations.
- The diagram is manually constructed using Shapes in MS Excel.
- Each rectangle in the diagram represents an Essential Process which has been captured in Nintex Process Manager.
- Processes linked as Inputs & Outputs in Nintex Process Manager were used to formulate the connections points between the critical processes in the diagram.

Toggles of the Critical Operations Ecosystem

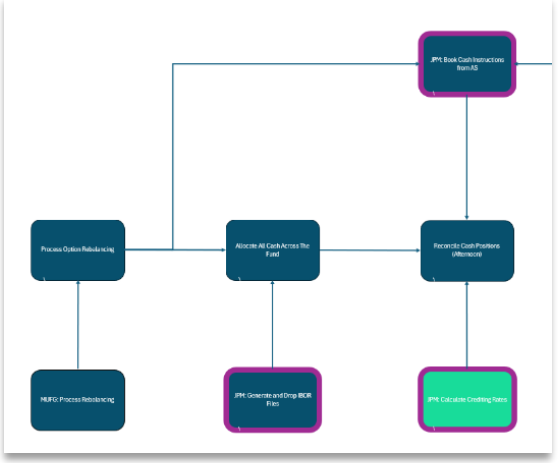
There are several uses for the Ecosystem, and various toggles to show different views across the landscape. Below outlines the different uses and toggles, and how to enable them in the Ecosystem.

The view within the tool can be filtered by the following:

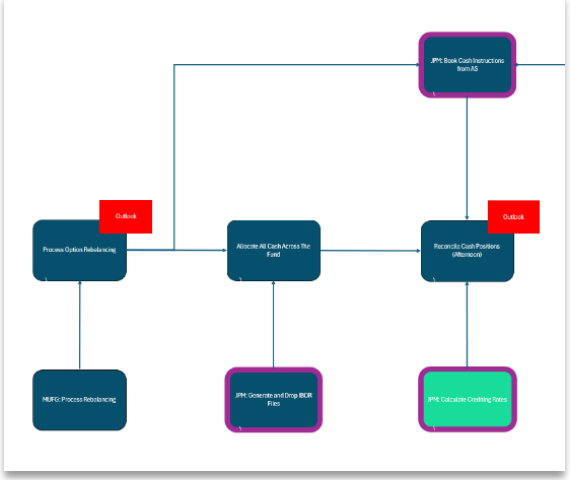
- Any permutation of the 16 Critical Operations.
- Critical Operations and Essential Processes that our Material Service Providers perform.
- Systems used to support the Critical Operations and Essential Processes.
- Global locations of the Critical Operations and Essential Processes.



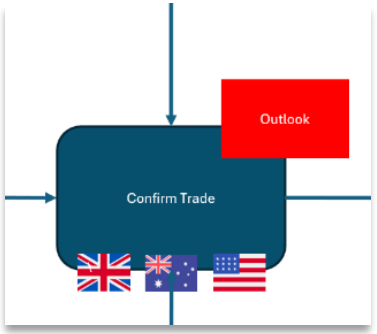
Critical Operations toggled in the Ecosystem, represented by the fill colour.



Material Service Providers toggled in the Ecosystem, represented by the coloured bordering.



Systems toggled in the Ecosystem, represented by the red rectangle on the top right corner of the process.

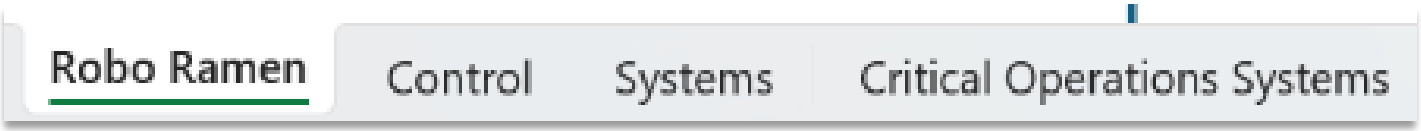


Global locations in the Ecosystem, represented by the flag on top of the process.

Control Data Tables

The Critical Operations Ecosystem is configured and driven via tables of data which have been extracted out of the Fund's Business Process platform, Nintex. These tables are captured in the following tabs of the file.

- Control
- Systems
- Critical Operations Systems



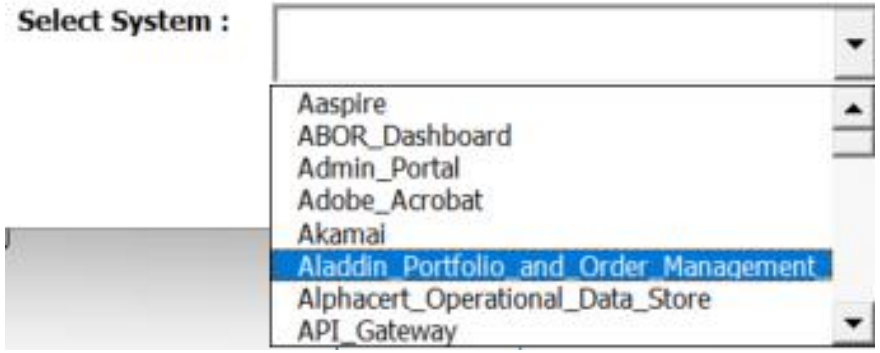
Control

This table of data controls the toggles for the Critical Operations, Material Service Providers and Global Locations.

Column	Data Element	Description
Column A	Critical Operation	Determines the Critical Operation the Process is associated to.
Column B	Process	Name of the Process as per titled in Nintex.
Column C	Shape Name	Name given to the shape that represents the process on the Ecosystem.
Column D	System Name	Name given to the shape that displays the System when toggled.
Column E	Metric Name	Name given to the shape that displays the Metric when toggled.
Column F	AUS Name	Name given to the shape that displays the AU icon on the process shape.
Column G	UK Name	Name given to the shape that displays the UK icon on the process shape.
Column H	US Name	Name given to the shape that displays the US icon on the process shape.
Column I	MSP	The Material Service Provider that performs the process for the Critical Operation.
Column J	AUS	Denoted by a ‘Y’ where the process is performed in AU
Column K	UK	Denoted by a ‘Y’ where the process is performed in UK
Column L	US	Denoted by a ‘Y’ where the process is performed in US

Systems

This table of data controls the list of Systems that appear in the System drop down list of the Toggle Interface. This list of systems is obtained from the System Map report from Nintex and filtered against the list of CPS230 related processes.



Critical Operations Systems

This table of data controls the mapping of Essential Processes and the systems and applications that are utilised in the processes. The data is obtained from the Systems Map extract from Nintex, and filtered against the list of CPS230 processes.

Column	Data Element	Description
Column A	System	System or Application utilised in the process.
Column B	Critical Operation	Determines the Critical Operation the System and Process is associated to.
Column C	Process	The Essential Process the system is utilised in.
Column D	Process Step	The referenced process step in Nintex that the system is mentioned in.
Column E	Activity/Task	Description of the Activity or Task in the process where the system is referenced.
